ABSTRACT

TOWARD GUARANTEED STABILITY IN THE HAPTIC DISPLAY OF VIRTUAL ENVIRONMENTS

Jui-Chang Tsai

A haptic display is a device that allows human operators to manipulate and feel virtual environments. An important issue in the haptic display of virtual environments is stability. Often, unintended oscillations of the human/display system are found to occur. This dissertation addresses the problem of *guaranteed stability* in the haptic display of virtual environments. The approach taken to this problem is based upon ensuring not only discrete time stability, but also discrete time passivity. The introduction and background of this work are included in Part I.

In Part II, we consider the effect of unilateral nonlinearities on the stability of discrete-time control systems, a problem of some importance in haptic display. For example, a virtual wall is a simple form of *unilateral constraint*. Sufficient conditions for the stability of linear, shift-invariant systems in feedback with unilateral nonlinearities are derived. The derivation follows a method originally presented by Mitra in which the existence of periodic oscillations is first assumed, then conditions leading to a contradiction are found. The results developed here are presented graphically in the Nyquist plane, allowing direct comparison to other well-known criteria, such as Tsytkin's Condition. It is shown that the new criterion is much less conservative.

In Part III, we show that A-stability relates to the passivity of the discrete time

simulation. If A-stable methods are used to map linear time-invariant systems to discrete time, the results will be discrete time passive. Furthermore, the need for real-time simulations of complex dynamic systems in haptic display suggests that simulations may need to be distributed across a network of processors. A parallel simulation structured in a physically meaningful way allows the user to apply the powerful insights and methods of physical network theory. We show that, by modeling junctions in the simulation network using transmission lines, the inherent delays are accommodated, and discrete time passivity is guaranteed.

In conclusion, we are able to construct A-stable simulation networks through the transmission line model and A-stable integration technique. We believe that this is a promising approach to the real-time, A-stable simulation of multibody systems.

ACKNOWLEDGMENTS

I wish to thank my advisor, Professor Ed Colgate, for his untiring advice and guidance over the years of my studies. I shall be deeply grateful to him all my life.

I wish to acknowledge also the many contributions to this dissertation by the other members of my thesis committee, Professors Kornel F. Ehmann and Michael A. Peshkin.

I would like to thank also the colleagues in LIMS for their valuable discussions and friendship.

Finally, many thanks to my wife, Wen-Tsu, for her encouragement and patience throughout all these days.

TABLE OF CONTENTS

Part I	Introduction	1
1.	Haptic Display	2
1.1	Instability and Passivity	3
1.2	Specific Objectives	5
2.	Background	7
Part II	Stability in the Presence of Unilateral Nonlinearities	13
	Abstract	14
3.	Motivation and Problem Statement	16
3.1	Motivation	16
3.2	Background	18
3.2.1	Review of Absolute Stability Criteria	18
3.2.1.1	Circle Criterion	18
3.2.1.2	Popov Criterion	24
3.2.1.3	Tsytkin Criterion	26
3.2.2	A Criterion Due to Mitra	28
3.3	Problem Statement	30
4.	A New Stability Criterion	34
4.1	Derivation	34
4.1.1	Conditions for the Absence of Oscillations	34
4.1.1.1	Properties of the Nonlinearity Set	38
4.1.1.2	Description of $H(z)$	39
4.1.1.3	Conditions for the Existence of Periodic Oscillations	39
4.1.1.4	Mathematical Statement of the Stability Criterion	43

4.1.1.5	Graphical Interpretation	44
4.2	An Example	48
4.3	Conclusions and Future Work.....	56
Part III	A-Stable Distributed Simulation.....	58
5.	Motivation and Problem Statement.....	59
5.1	Stability and Passivity of Discrete Time Simulations	59
5.2	A-Stable Methods	63
5.3	Real-Time Simulation of Rigid Body Systems	67
5.3.1	Dependent Variables.....	69
5.3.2	Independent Variables.....	72
5.3.3	Impulse-Based Methods	75
5.4	Problem Statement: A-Stability and Parallel Integration	76
6.	A Network Approach to Distributed Simulation.....	77
6.1	Network Methods	77
6.2	Analysis of a Simple Junction	80
6.3	Passive Junctions.....	85
6.4	Examples	92
6.4.1	Bilateral Constraint	92
6.4.2	Unilateral Constraint.....	99
6.5	Analysis of General Constrained Dynamic System	106
6.5.1	Planar Prismatic Joint Constraint	119
6.5.2	Planar Revolute Joint Constraint.....	124
6.5.3	Planar Revolute-Translational Composite Joint Constraint	129
6.5.4	Solution-Procedure for the Planar Dynamic Equations.....	135
6.5.5	Illustration Example: Double Pendulum.....	137

7. Conclusions and Future Work	143
